(54) Title: **REFLECTING MODULATOR CIRCUIT COMPRISING A NEGATIVE IMPEDANCE AMPLIFIER**

(57) Abstract: A modulator circuit comprises a negative impedance amplifier (6) which is operable such that a signal applied to the amplifier (6) is reflected and amplified. Switching means (14, 16) are provided for switching the impedance of the amplifier (6) between two reflecting states such that the reflected and amplified signal is phase modulated. The impedances of the negative impedance amplifier are selected such that the phase of the reflected and amplified signal switches by substantially 180 degrees. Preferably the impedances of the negative impedance amplifier in the two reflecting states are selected such that the reflection gain of the amplifier in the two reflecting states is substantially the same such that the reflected and amplified signal is a binary phase shift keyed.

WO 01/01649 A1

REFLECTING MODULATOR CIRCUIT COMPRISING A NEGATIVE IMPEDANCE AMPLIFIER

This invention relates to a modulator circuit and more especially to such a circuit for generating binary phase shift key modulation.

Modulation, which can be broadly defined as a time varying modification of a signal to impart information thereto, is a crucial feature of the design of almost all radio based systems. An effective and well known form of modulation for digital signals, is binary phase shift keying (BPSK). In BPSK one of the two digital states of information is imparted onto a carrier signal by modulating its phase to have two discrete values which are generally separated by 180 degrees (π radians). Whilst such a modulation technique may be efficient it has not previously been ideally suited for applications where low cost and low power consumption are paramount such as in tagging systems, since the known circuitry for generating BPSK is complex and consumes too much electrical power for operation from a finite battery supply.

The present invention has arisen in an endeavour to provide a modulator circuit which at least in part overcomes the limitations of the known modulators and which is suitable for use in a tagging systems or other applications where low power consumption and circuit simplicity are of importance.

According to the present invention a modulator circuit comprises: a negative impedance amplifier operable such that a signal applied to the amplifier is reflected and amplified and switching means for switching the impedance of the amplifier between two

reflecting states, characterised in that the impedances in the two reflecting states are selected such that the phase of the reflected and amplified signal switches by substantially 180 degrees.

- 5 Preferably the impedances in the two reflecting states are selected such that the reflection gain of the amplifier in the two reflecting states is substantially the same such that the reflected and amplified signal is a binary phase shift keyed.

Alternatively the impedances in the two reflecting states are selected such that the
10 reflection gain of the amplifier in the two reflecting states is different and wherein said impedances are selected such the reflected and amplified signal is a substantially single sideband signal.

In a particularly preferred embodiment the negative impedance amplifier comprises a
15 transistor, such as for example a bipolar or field effect transistor, and biasing means for biasing the transistor such as to act as a negative impedance amplifier. Such a modulator circuit is found to be particularly advantageous since it in essence can comprise only a single component. Furthermore, a negative impedance amplifier is capable of providing high gain at very low current, so its power consumption can
20 accordingly be very low of the order of a few micro-amps. Conveniently when using a transistor the switching means switches the biasing of the transistor to switch the transistor between the two reflecting states.

Advantageously the modulator circuit further comprises an antenna for receiving

radiation and converting it to the signal applied to the amplifier and for radiating the reflected and amplified signal.

According to a second aspect of the invention there is provided a demodulator circuit
5 for demodulating a Binary phase shift keyed signal which incorporates the modulator circuit described above.

According to a third aspect of the invention there is provided a transponder tag which incorporates the modulator circuit described above.

10

A modulator circuit in accordance with the invention will now be described by way of example only with reference to the accompanying drawings in which:

Figure 1 is a schematic representation of a transponder circuit which incorporates a
15 modulator circuit in accordance with the invention;

Figure 2 is a schematic representation of a de-spreader circuit for use in a spread spectrum communication system which incorporates the modulator circuit of Figure 1;
and

20

Figure 3 is a schematic representation of a spread spectrum communication system incorporating the modulator circuit of Figure 1.

Referring to Figure 1 there is shown a microwave frequency (2.45 GHz) pseudo passive

transponder tag 1 for use in a tagging system which incorporates a modulator circuit 2 in accordance with the invention. The tag 1 comprises an antenna 4 which is connected to the modulator circuit 2. The modulator circuit 2 comprises: a gallium arsenide (GaAs) field effect transistor (FET) 6, impedance matching/feedback networks 8,10,12
5 connected to a respective transistor terminal, a switchable current source 14 and a control circuit 16. The antenna 4, which for operation at microwave frequencies conveniently comprises a patch antenna, is connected to the gate electrode 6_g of the FET 6 via the matching network 8 which conveniently comprises a transmission line element. The drain electrode 6_d of the FET 6 is connected to a positive supply V_{supply}
10 by the matching network 10. The source electrode 6_s connected to ground via the matching network 12 and the switchable current source 14. The current source 14 is controlled by the control circuit 16 via a control line 18.

In a known manner the FET 6 is biased by a biasing network which comprises the
15 matching/feedback networks 8, 10, 12 such that it operates in a linear relatively high gain region of its current/voltage characteristic. Conveniently each of the networks 8,10,12 comprises a transmission line element. The FET 6 thus amplifies and reflects any signal appearing at its gate electrode 6_g and therefore acts as a negative impedance amplifier. This being said, it will be appreciated that in most applications the
20 impedance of the amplifier is primarily resistive.

The magnitude of the negative impedance of the modular circuit 2 is dependent on the drain/source current I_{ds} passing through the transistor 6 and this current is determined by the switchable current source 14. The current source 14 is switchable between two

selected currents I_{ds1} and I_{ds2} in dependence upon control circuit 16. For both currents I_{ds1} and I_{ds2} the FET 6 operates as a negative impedance amplifier though for each current the magnitude of its negative impedance is different.

- 5 In operation of the circuit 1 the antenna 4 receives and converts microwave radiation 19 into an electrical signal which is applied via the matching network 8 to the gate 6_g of the FET 6. As described above the FET 6 acts as a negative impedance amplifier and the electrical signal is reflected and amplified by the FET 6 and re-radiated as microwave radiation 20 from the antenna 4. In the case of tagging systems the
- 10 microwave radiation 19 is an interrogating radiation signal which can be a continuous wave or modulated wave signal. To impart information to the radiation 20 the control circuit 16 switches between the two currents I_{ds1} and I_{ds2} such that the phase of the radiation 20 switches by 180 degrees. An important feature of the invention is the selection of the magnitude of the negative impedance of the circuit 2 for the two
- 15 currents I_{ds1} and I_{ds2} . These are selected such that (i) the circuit has the same reflection gain for each current and (ii) the phase between the reflected and amplified signal for the two currents is switched by 180 degrees. The reflection gain (in decibels dB) of the circuit 1 as seen looking toward the gate terminal 6_g is given by:

$$\text{gain} = 20 \log \left| \frac{Z_n - Z_o}{Z_n + Z_o} \right|$$

- where Z_o is the antenna impedance (or in the case where no antenna is present, it is the
- 20 system impedance) and Z_n is the input impedance presented by the FET 6 (that is the negative impedance looking towards the gate 6_g). For the embodiment shown in Figure

I the system/antenna impedance is nominally 50 ohms and the value of the negative impedance is switchable between -45 and -55.555 ohms for I_{ds1} and I_{ds2} respectively to give a reflection gain in each case of 25dB. It is to be noted that for these impedance values whilst the reflection gain is constant, the phase of the reflected and amplified signals will be altered by 180 degrees. This change of phase is indicated by the change of the sign of the term $(Z_n - Z_o) \div (Z_n + Z_o)$. Thus for the example of Figure 1 I_{ds1} is selected such that the FET 6 operates as a negative impedance of -45 ohms and I_{ds2} is selected such that the FET 6 operates as negative impedance of -55.555 ohms. It will be appreciated therefore that the circuit 2 acts as a binary phase shift key reflective modulator. A particular advantage of the modulator circuit 2 is that it provides a simple method of generating BPSK and offers the additional benefit that it also amplifies the signal which it is modulating. Due to the circuit's simplicity it is ideally suited to tagging applications where it further has the advantage that it is capable of operating at very low currents (of the order of a few micro-amps) for an operating frequency of 2.4GHz.

With different values for the respective impedances, both the magnitude and phase of the reflected signal can be varied between the two states, such that a combination of amplitude modulation (AM) and phase modulation (PM) can be applied. With an appropriate combination of the two forms of modulation the radiated signal 20 can be arranged to be a substantially single sideband signal.

Referring to Figure 2 there is shown a schematic of a de-spreader circuit 21 for use in a spread spectrum communication system such as for example of the type used in a

global positioning system. As is known in such spread spectrum systems a carrier signal is modulated with a digital code, most often a pseudo random binary sequence (PRBS), to spread its energy spectra. Commonly the modulation used is BPSK. The circuit 21 is intended for de-spreading such spread spectrum radiation to recover the original carrier signal and any modulation applied thereto. This is achieved by using the modulator 2 of Figure 1 to apply a replica of the sequence used to generate the spread spectrum. It will be appreciated that the sequence applied by the circuit 21 is additionally in time synchronisation with the generating sequence.

10 The circuit 21 comprises; an antenna 22 for receiving broad band spread spectrum radiation 23, a broad pass-band filter 24, a narrow stop-band filter 25, a narrow pass-band filter 26 and a modulator circuit 2. The broad pass-band filter 24, narrow stop-band filter 25 and narrow pass-band filter 26 are connected in series and the output 28 of the narrow pass-band filter 26 provides the output 28 of the circuit 21. The antenna 22 is connected to the input 30 of the broad band filter 24. The modulator circuit 2, which is identical to the circuit shown in Figure 1, is connected to the interconnection 32 of the filters 25 and 26.

20 The reflective modulator circuit 2 has a gain of 20dB in both reflecting states. The reflecting state of the modulator 2 is controlled by a digital signal 34, which as described above is a replica of the original sequence signal used to generate the broad band signal 23. Most typically the signal 34 is a PRBS signal.

In operation the broad band spread radiation 23 is received and converted to an

electrical signal by the antenna 22 and passes through the broad pass-band filter 24 and narrow stop-band filter 25. The pass-band of the filter 24 defines the bandwidth of operation of the circuit 21. The centre frequency of the stop-band filter 25 is selected to correspond with the carrier frequency of the radiation 23 to block any components at the carrier frequency. The filtered signal appearing at the output 32a of the filter 25 is applied to both the input 32b of the narrow pass-band filter 26 and to the input 32c of the modulator 2. Due to the pass-band pass characteristic of the narrow band-pass filter 26 the filtered signal is blocked by the filter 26. The filtered signal however appearing at the input 32c of the modulator circuit 2 is de-modulated to produce an amplified version of the original carrier signal which is reflected back to the interconnection 32. The amplified carrier signal, which is within the band pass characteristic of the narrow pass-band filter 26, passes through substantially unattenuated to the output 28. The demodulated signal is prevented from returning to the antenna 22 by the stop-band filter 25. The circuit 20 thus operates as a de-spreader circuit and is capable of operating at substantially lower currents than those which currently use digital techniques.

A further example of an application of the reflector modulator in accordance with the invention is now described with reference to Figure 3 which is a schematic of a spread spectrum communication system 40 for use in covert communications between a transmitter 42 and a hand held radio receiver 44. As is known spreading the spectra of the transmitted signal, and hence spreading the energy over a large frequency range, makes it more difficult for the signal to be detected by unauthorised persons and hence for such persons to determine the position of the transmitting source.

Referring to Figure 3 the communication system 40 comprises: a spread spectrum transmitter 42 of a known type which generates a BPSK modulated broad band spread spectrum radiation 46, a reflective de-spreading circuit 48 and a hand held radio receiver 44. The de-spreader circuit 48 is identical to the transponder circuit 1 of Figure 1 in which the control circuit 16 switches the transistor 6 using an identical code to that used by the transmitter 42 to generate the spread signal 46. The de-spreader circuit 48 thus receives the broad band radiation 46 and in response radiates an amplified and de-spread narrow band radiation 50 which represents the recovered carrier of the signal 46 and any modulation applied thereto. The narrow band radiation 50 is detected by the hand held radio receiver 44. The de-spreading circuit 48 is preferably mounted at a high point such as on the side of a building 52 or other structure such as a post or a tree. Since the radiation 46 generated by the transmitter 42 is broad band this makes it difficult for a direction finding receiver to locate the position of the transmitter 42. Although such a direction finding receiver may be able to locate the narrow band radiated emissions 50 from the de-spreading circuit 48 and hence determine its position, it will still be unable to determine the position of the transmitter 42. In a preferred communication system a number of de-spreading circuits 48 (a second such circuit 48a is shown in Figure 3), each having a different modulation code, are located at different physical locations. The transmitter 42 is operable to switch between the different modulating codes during communication with the hand held radio 44 such that different de-spreading circuits 48 become activated. As a result the position from which the narrow band radiation 50, 50a originates will jump from de-spreading circuit 48 to de-spreading circuit 48a, thereby hampering any attempt to locate the position of the de-spreading circuit.

It will be appreciated that modifications can be made to the circuits described which are still within the scope of the invention. For example whilst in the examples described the modulator circuit uses a field effect transistor, which is much preferred for operation of microwave frequencies, the negative impedance amplifier can be
5 implemented in different ways, depending upon the required frequency of operation, such as for example using a bi-polar transistor or other active devices. Furthermore the modulator circuit of the invention is not restricted to the applications described and is suited for use in any application which requires BPSK modulation. The present invention resides in the realisation that binary phase shift key modulation can be
10 achieved by using a reflection amplifier and switching the circuit between two reflecting states which preferably have the same reflection gain (though this is not essential when single sideband operation is required), but which change the phase of the reflected signal by substantially 180 degrees.

CLAIMS

1. A modulator circuit (2) comprising: a negative impedance amplifier (6) operable such that a signal applied to the amplifier is reflected and amplified and switching means (14, 16) for switching the impedance of the amplifier (6) between two reflecting states, characterised in that the impedances in the two reflecting states are selected such that the phase of the reflected and amplified signal switches by substantially 180 degrees.
2. A modulator circuit according to Claim 1 in which the impedances in the two reflecting states are selected such that the reflection gain of the amplifier (6) in the two reflecting states is substantially the same such that the reflected and amplified signal is a binary phase shift keyed.
3. A modulator circuit according to Claim 1 in which the impedances in the two reflecting states are selected such that the reflection gain of the amplifier (6) in the two reflecting states is different and wherein said impedances are selected such the reflected and amplified signal is a substantially single sideband signal.
4. A modulator circuit according to Claim 1 or Claim 2 in which the negative impedance amplifier comprises a transistor (6) and biasing means (10, 12, 14) for biasing the transistor such as to act as negative impedance amplifier.

5. A modulator circuit according to Claim 4 in which the switching means (14, 16) switches the biasing of the transistor (6) to switch the transistor between the two reflecting states.
6. A modulator circuit according to any preceding claim and further comprising an antenna (4) for receiving radiation (19) and converting it to the signal applied to the amplifier (6) and for radiating (20) the reflected and amplified signal.
7. A modulator circuit according to any one of Claims 4, 5 or 6 in which the transistor (6) comprises a bipolar transistor.
8. A modulator circuit according to any one of Claims 4, 5 or 6 in which the transistor (6) comprises a field effect transistor.
9. A de-modulator circuit (21) for de-modulating a Binary Phase Shift Keyed signal incorporating a modulator circuit (2) according to any preceding claim.
10. A transponder tag incorporating a modulator circuit according to any preceding claim.

ATTENTION

The applicant should carefully check the data appearing in this Notification. In case of any discrepancy between these data and the indications in the international application, the applicant should immediately inform the International Bureau.

In addition, the applicant's attention is drawn to the information contained in the Annex, relating to:

- ☒ time limits for entry into the national phase
☐ confirmation of precautionary designations
☒ requirements regarding priority documents

A copy of this Notification is being sent to the receiving Office and to the International Searching Authority.

The International Bureau of WIPO 34, chemin des Colombettes 1211 Geneva 20, Switzerland	Authorized officer: Ingrid Aulich
Facsimile No. (41-22) 740.14.35	Telephone No. (41-22) 838.83.38

INFORMATION ON TIME LIMITS FOR ENTERING THE NATIONAL PHASE

The applicant is reminded that the "national phase" must be entered before each of the designated Offices indicated in the Notification of Receipt of Record Copy (Form PCT/IB/301) by paying national fees and furnishing translations, as prescribed by the applicable national laws.

The time limit for performing these procedural acts is **20 MONTHS** from the priority date or, for those designated States which the applicant elects in a demand for international preliminary examination or in a later election, **30 MONTHS** from the priority date, provided that the election is made before the expiration of 19 months from the priority date. Some designated (or elected) Offices have fixed time limits which expire even later than 20 or 30 months from the priority date. In other Offices an extension of time or grace period, in some cases upon payment of an additional fee, is available.

In addition to these procedural acts, the applicant may also have to comply with other special requirements applicable in certain Offices. It is the applicant's responsibility to ensure that the necessary steps to enter the national phase are taken in a timely fashion. Most designated Offices do not issue reminders to applicants in connection with the entry into the national phase.

For detailed information about the procedural acts to be performed to enter the national phase before each designated Office, the applicable time limits and possible extensions of time or grace periods, and any other requirements, see the relevant Chapters of Volume II of the PCT Applicant's Guide. Information about the requirements for filing a demand for international preliminary examination is set out in Chapter IX of Volume I of the PCT Applicant's Guide.

GR and ES became bound by PCT Chapter II on 7 September 1996 and 6 September 1997, respectively, and may, therefore, be elected in a demand or a later election filed on or after 7 September 1996 and 6 September 1997, respectively, regardless of the filing date of the international application. (See second paragraph above.)

Note that only an applicant who is a national or resident of a PCT Contracting State which is bound by Chapter II has the right to file a demand for international preliminary examination.

CONFIRMATION OF PRECAUTIONARY DESIGNATIONS

This notification lists only specific designations made under Rule 4.9(a) in the request. It is important to check that these designations are correct. Errors in designations can be corrected where precautionary designations have been made under Rule 4.9(b). The applicant is hereby reminded that any precautionary designations may be confirmed according to Rule 4.9(c) before the expiration of 15 months from the priority date. If it is not confirmed, it will automatically be regarded as withdrawn by the applicant. There will be no reminder and no invitation. Confirmation of a designation consists of the filing of a notice specifying the designated State concerned (with an indication of the kind of protection or treatment desired) and the payment of the designation and confirmation fees. Confirmation must reach the receiving Office within the 15-month time limit.

REQUIREMENTS REGARDING PRIORITY DOCUMENTS

For applicants who have not yet complied with the requirements regarding priority documents, the following is recalled.

Where the priority of an earlier national, regional or international application is claimed, the applicant must submit a copy of the said earlier application, certified by the authority with which it was filed ("the priority document") to the receiving Office (which will transmit it to the International Bureau) or directly to the International Bureau, before the expiration of 16 months from the priority date, provided that any such priority document may still be submitted to the International Bureau before that date of international publication of the international application, in which case that document will be considered to have been received by the International Bureau on the last day of the 16-month time limit (Rule 17.1(a)).

Where the priority document is issued by the receiving Office, the applicant may, instead of submitting the priority document, request the receiving Office to prepare and transmit the priority document to the International Bureau. Such request must be made before the expiration of the 16-month time limit and may be subjected by the receiving Office to the payment of a fee (Rule 17.1(b)).

If the priority document concerned is not submitted to the International Bureau or if the request to the receiving Office to prepare and transmit the priority document has not been made (and the corresponding fee, if any, paid) within the applicable time limit indicated under the preceding paragraphs, any designated State may disregard the priority claim, provided that no designated Office may disregard the priority claim concerned before giving the applicant an opportunity to furnish the priority document within a time limit which is reasonable under the circumstances.

Where several priorities are claimed, the priority date to be considered for the purposes of computing the 16-month time limit is the filing date of the earliest application whose priority is claimed.

Applicant MARCONI CASWELL LIMITED et al	

1. The applicant is hereby notified of the date of receipt (except where the letters "NR" appear in the right-hand column) by the International Bureau of the priority document(s) relating to the earlier application(s) indicated below. Unless otherwise indicated by an asterisk appearing next to a date of receipt, or by the letters "NR", in the right-hand column, the priority document concerned was submitted or transmitted to the International Bureau in compliance with Rule 17.1(a) or (b).
2. This updates and replaces any previously issued notification concerning submission or transmittal of priority documents.
3. An asterisk(*) appearing next to a date of receipt, in the right-hand column, denotes a priority document submitted or transmitted to the International Bureau but not in compliance with Rule 17.1(a) or (b). In such a case, **the attention of the applicant is directed** to Rule 17.1(c) which provides that no designated Office may disregard the priority claim concerned before giving the applicant an opportunity, upon entry into the national phase, to furnish the priority document within a time limit which is reasonable under the circumstances.
4. The letters "NR" appearing in the right-hand column denote a priority document which was not received by the International Bureau or which the applicant did not request the receiving Office to prepare and transmit to the International Bureau, as provided by Rule 17.1(a) or (b), respectively. In such a case, **the attention of the applicant is directed** to Rule 17.1(c) which provides that no designated Office may disregard the priority claim concerned before giving the applicant an opportunity, upon entry into the national phase, to furnish the priority document within a time limit which is reasonable under the circumstances.

IMPORTANT NOTICE		
International application No. PCT/GB00/02200	International filing date (day/month/year) 07 June 2000 (07.06.00)	Priority date (day/month/year) 25 June 1999 (25.06.99)
Applicant MARCONI CASWELL LIMITED et al		

1. Notice is hereby given that the International Bureau has communicated, as provided in Article 20, the international application to the following designated Offices on the date indicated above as the date of mailing of this Notice:

AG,AU,DZ,KP,KR,MZ,US

In accordance with Rule 47.1(c), third sentence, those Offices will accept the present Notice as conclusive evidence that the communication of the international application has duly taken place on the date of mailing indicated above and no copy of the international application is required to be furnished by the applicant to the designated Office(s).

2. The following designated Offices have waived the requirement for such a communication at this time:

AE,AL,AM,AP,AT,AZ,BA,BB,BG,BR,BY,CA,CH,CN,CR,CU,CZ,DE,DK,DM,EA,EE,EP,ES,FI,GB,GD,

NO,NZ,OA,PL,PT,RO,RU,SD,SE,SG,SI,SK,SL,TJ,TM,TR,TT,TZ,UA,UG,UZ,VN,YU,ZA,ZW

The communication will be made to those Offices only upon their request. Furthermore, those Offices do not require the applicant to furnish a copy of the international application (Rule 49.1(a-bis)).

3. Enclosed with this Notice is a copy of the international application as published by the International Bureau on
04 January 2001 (04.01.01) under No. WO 01/01649

REMINDER REGARDING CHAPTER II (Article 31(2)(a) and Rule 54.2)

If the applicant wishes to postpone entry into the national phase until 30 months (or later in some Offices) from the priority date, a demand for international preliminary examination must be filed with the competent International Preliminary Examining Authority before the expiration of 19 months from the priority date.

It is the applicant's sole responsibility to monitor the 19-month time limit.

Note that only an applicant who is a national or resident of a PCT Contracting State which is bound by Chapter II has the right to file a demand for international preliminary examination.

REMINDER REGARDING ENTRY INTO THE NATIONAL PHASE (Article 22 or 39(1))

If the applicant wishes to proceed with the international application in the national phase, he must, within 20 months or 30 months, or later in some Offices, perform the acts referred to therein before each designated or elected Office.

For further important information on the time limits and acts to be performed for entering the national phase, see the Annex to Form PCT/IB/301 (Notification of Receipt of Record Copy) and Volume II of the PCT Applicant's Guide.

MZ, PT, SD, SG, SI, SL, TJ, TM, TR, TT, TZ, UA, UG, UZ, VN, YU, ZA, ZW

3. The applicant is reminded that he must enter the "national phase" before the expiration of 30 months from the priority date before each of the Offices listed above. This must be done by paying the national fee(s) and furnishing, if prescribed, a translation of the international application (Article 39(1)(a)), as well as, where applicable, by furnishing a translation of any annexes of the international preliminary examination report (Article 36(3)(b) and Rule 74.1).

Some offices have fixed time limits expiring later than the above-mentioned time limit. For detailed information about the applicable time limits and the acts to be performed upon entry into the national phase before a particular Office, see Volume II of the PCT Applicant's Guide.

The entry into the European regional phase is postponed until 31 months from the priority date for all States designated for the purposes of obtaining a European patent.

MARCONI CASWELL LIMITED

1. This written opinion is the **first** drawn up by this International Preliminary Examining Authority.
2. This opinion contains indications relating to the following items:
 - I ☒ Basis of the opinion
 - II ☐ Priority
 - III ☐ Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
 - IV ☐ Lack of unity of invention
 - V ☒ Reasoned statement under Rule 66.2(a)(ii) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
 - VI ☐ Certain document cited
 - VII ☒ Certain defects in the international application
 - VIII ☐ Certain observations on the international application
3. The applicant is hereby **invited to reply** to this opinion.

When? See the time limit indicated above. The applicant may, before the expiration of that time limit, request this Authority to grant an extension, see Rule 66.2(d).

How? By submitting a written reply, accompanied, where appropriate, by amendments, according to Rule 66.3. For the form and the language of the amendments, see Rules 66.8 and 66.9.

Also: For an additional opportunity to submit amendments, see Rule 66.4.
For the examiner's obligation to consider amendments and/or arguments, see Rule 66.4 bis.
For an informal communication with the examiner, see Rule 66.6.

If no reply is filed, the international preliminary examination report will be established on the basis of this opinion.
4. The final date by which the international preliminary examination report must be established according to Rule 69.2 is: 25/10/2001.

Name and mailing address of the international preliminary examining authority:

 European Patent Office - Gitschiner Str. 103
 D-10958 Berlin

 Formalities officer (incl. extension of time limits)
Aldridge, S
 Telephone No. +49 30 25901 735

I. Basis of the opinion

1. This opinion has been drawn on the basis of (*substitute sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this opinion as "originally filed".*):

Description, pages:

1-10 as originally filed

Claims, No.:

1-10 as originally filed

Drawings, sheets:

1/3-3/3 as originally filed

2. With regard to the **language**, all the elements marked above were available or furnished to this Authority in the language in which the international application was filed, unless otherwise indicated under this item.

These elements were available or furnished to this Authority in the following language: , which is:

- ☐ the language of a translation furnished for the purposes of the international search (under Rule 23.1(b)).
- ☐ the language of publication of the international application (under Rule 48.3(b)).
- ☐ the language of a translation furnished for the purposes of international preliminary examination (under Rule 55.2 and/or 55.3).

3. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international preliminary examination was carried out on the basis of the sequence listing:

- ☐ contained in the international application in written form.
- ☐ filed together with the international application in computer readable form.
- ☐ furnished subsequently to this Authority in written form.
- ☐ furnished subsequently to this Authority in computer readable form.
- ☐ The statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.
- ☐ The statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished.

4. The amendments have resulted in the cancellation of:

- ☐ the description, pages:
- ☐ the claims, Nos.:

WRITTEN OPINION

International application No. PCT/GB00/02200

☐ the drawings, sheets:

5. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):

(Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.)

6. Additional observations, if necessary:

V. Reasoned statement under Rule 66.2(a)(ii) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Statement

Novelty (N)	Claims
Inventive step (IS)	Claims 1 3-6 8-10
Industrial applicability (IA)	Claims

2. Citations and explanations
see separate sheet

VII. Certain defects in the international application

The following defects in the form or contents of the international application have been noted:
see separate sheet

Re Item V

1. Reference is made to the following documents:

D1: US 5 305 469 A (CAMIADE MARC ET AL) 19 April 1994 (1004-04-19)

D2: EP 0 324 564 A (SONY CORP) 19 July 1989 (1989-07-19)

D3: EP 0 288 035 A (SHARP KK) 26 October 1988 (1988-10-26)

2. The present application does not meet the requirements of Article 33(1) PCT, because the subject matter of claims 1, 3-6 and 7-10 does not involve an inventive step in the sense of Article 33(3) PCT.

- 2.1 The document D1 is regarded as being the closest prior art to the subject matter of claim 1 (see D1; column 4, lines 25-40; column 5, lines 54-61; column 7, lines 20-31; figure 6), and discloses (the references in parentheses applying to this document):

A modulator (3) comprising: a negative impedance amplifier (11) operable such that a signal applied to the amplifier is reflected and amplified, switching means (28) for switching the impedance between two states, and a binary phase modulator (39) for switching the phase of the reflected and amplified signal.

- 2.2 The subject matter of claim 1 therefore differs from this disclosed in D1 in that the same amplifier is used to reflect and to phase modulate the signal.
- 2.3 The problem to be solved by the present application may therefore be regarded as how to reduce the number of components.
- 2.4 The presently claimed solution is considered to be obvious, because document D2 discloses a single field effect transistor, the impedance of which is switched between two different reflecting states, such that the phase of a reflected signal switches between two values (see D2; column 4, line 60 - column 5, line 16; figure 1). A skilled person having knowledge of the teachings of D1 and faced with

the same technical problem would not overlook the solution disclosed in D2, lying in the same technical field and dealing with the same general technical problem. In doing so, he would arrive at the subject matter of claim 1, which is consequently not inventive.

2.5 By the same reasoning, the additional features of dependent claims 4-6 and 8-10 cannot be considered as inventive, because these features are also disclosed in D1. The same holds for dependent claim 3, the additional features of which are disclosed in D3.

3. The combination of the features of dependent claim 2 is neither known from, nor rendered obvious by, the available prior art. It is suggested therefore that a new independent claim is drafted to include these features, bearing in mind that the features known in combination in D1 and D2 should be placed in the preamble of such a claim in accordance with Rule 6.3(b) PCT.

Re Item VII

Certain defects in the international application

To meet the requirements of Rule 5.1(a)(ii) PCT, documents D1, D2 and D3 should be identified in the description and the relevant background art disclosed therein should be briefly discussed.

Applicant's or agent's file reference P/61715/MRCE	FOR FURTHER ACTION	See Notification of Transmittal of International Preliminary Examination Report (Form PCT/IPEA/416)
International application No. PCT/GB00/02200	International filing date (day/month/year) 07/06/2000	Priority date (day/month/year) 25/06/1999
International Patent Classification (IPC) or national classification and IPC H04L27/20		
Applicant MARCONI CASWELL LIMITED		

1. This international preliminary examination report has been prepared by this International Preliminary Examining Authority and is transmitted to the applicant according to Article 36.

2. This REPORT consists of a total of 5 sheets, including this cover sheet.

- ☐ This report is also accompanied by ANNEXES, i.e. sheets of the description, claims and/or drawings which have been amended and are the basis for this report and/or sheets containing rectifications made before this Authority (see Rule 70.16 and Section 607 of the Administrative Instructions under the PCT).

These annexes consist of a total of sheets.

3. This report contains indications relating to the following items:

- I ☒ Basis of the report
- II ☐ Priority
- III ☐ Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- IV ☐ Lack of unity of invention
- V ☒ Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- VI ☐ Certain documents cited
- VII ☒ Certain defects in the international application
- VIII ☐ Certain observations on the international application

Date of submission of the demand 16/01/2001	Date of completion of this report 31.08.2001
Name and mailing address of the international preliminary examining authority:  European Patent Office - Gitschiner Str. 103 D-10958 Berlin Tel. +49 30 25901 - 0 Fax: +49 30 25901 - 840	Authorized officer Masche, C Telephone No. +49 30 25901 471 

**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT**

International application No. PCT/GB00/02200

I. Basis of the report

1. With regard to the **elements** of the international application (*Replacement sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to this report since they do not contain amendments (Rules 70.16 and 70.17)*):

Description, pages:

1-10 as originally filed

Claims, No.:

1-10 as originally filed

Drawings, sheets:

1/3-3/3 as originally filed

2. With regard to the **language**, all the elements marked above were available or furnished to this Authority in the language in which the international application was filed, unless otherwise indicated under this item.

These elements were available or furnished to this Authority in the following language: , which is:

- ☐ the language of a translation furnished for the purposes of the international search (under Rule 23.1(b)).
☐ the language of publication of the international application (under Rule 48.3(b)).
☐ the language of a translation furnished for the purposes of international preliminary examination (under Rule 55.2 and/or 55.3).

3. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international preliminary examination was carried out on the basis of the sequence listing:

- ☐ contained in the international application in written form.
☐ filed together with the international application in computer readable form.
☐ furnished subsequently to this Authority in written form.
☐ furnished subsequently to this Authority in computer readable form.
☐ The statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.
☐ The statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished.

4. The amendments have resulted in the cancellation of:

- ☐ the description, pages:
☐ the claims, Nos.:

**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT**

International application No. PCT/GB00/02200

☐ the drawings, sheets:

5. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):

(Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.)

6. Additional observations, if necessary:

V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Statement

Novelty (N)	Yes:	Claims	1-10
	No:	Claims	
Inventive step (IS)	Yes:	Claims	1-10
	No:	Claims	
Industrial applicability (IA)	Yes:	Claims	1-10
	No:	Claims	

2. Citations and explanations
see separate sheet

VII. Certain defects in the international application

The following defects in the form or contents of the international application have been noted:
see separate sheet

Re Item V

1. Reference is made to the following documents:

D1: US 5 305 469 A (CAMIADE MARC ET AL) 19 April 1994 (1004-04-19)

D2: EP 0 324 564 A (SONY CORP) 19 July 1989 (1989-07-19)

D3: EP 0 288 035 A (SHARP KK) 26 October 1988 (1988-10-26)

2. The document D1 is regarded as being the closest prior art as it discloses in combination the following features of present claim 1 (see D1; column 4, lines 25-40; column 5, lines 54-61; column 7, lines 20-31; figure 6; the references in parentheses applying to this document):

A modulator (3) comprising: a negative impedance amplifier (11) operable such that a signal applied to the amplifier is reflected and amplified, switching means (28) for switching the impedance of the amplifier into a reflective state and means (39) for binary phase switching the reflected and amplified signal.

- 2.1 The essential difference between the subject-matter of claim 1 and D1 is, that in the claim the amplifier is switched between two reflecting states and that the impedances of the two reflective states are selected to achieve the phase modulation, whereas in document D1 an additional binary phase modulator is used.

Therefore, the subject-matter of claim 1 is new (Article 33(2) PCT).

- 2.3 The problem solved by these new features can therefore be considered as how to reduce the number of components.
- 2.4 Although documents D2 and D3 disclose modulators, in which a reflected signal is phase modulated by switching the impedance in reflective states, it is not obvious

**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT - SEPARATE SHEET**

International application No. PCT/GB00/02200

to combine this feature with the teachings of D1, because these documents are not related to an amplifier. Therefore, the application meets the requirements of Article 33(3) PCT with respect to inventive step.

2.5 Claims 2-10 are dependent on claim 1 and, therefore, also meet the requirements of the PCT with respect to novelty and inventive step.

Re Item VII

Certain defects in the international application

To meet the requirements of Rule 5.1(a)(ii) PCT, documents D1, D2 and D3 should have been identified in the description and the relevant background art disclosed therein should have been briefly discussed.

International filing date (day/month/year)
07/06/2000

Priority date (day/month/year)
25/06/1999

Applicant

MARCONI CASWELL LIMITED

1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

International application No. PCT/GB00/02200

☐ the drawings, sheets:

5. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):

(Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.)

6. Additional observations, if necessary:

V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Statement

Novelty (N)	Yes: Claims 1-10
	No: Claims
Inventive step (IS)	Yes: Claims 1-10
	No: Claims
Industrial applicability (IA)	Yes: Claims 1-10
	No: Claims

2. Citations and explanations
see separate sheet

VII. Certain defects in the international application

The following defects in the form or contents of the international application have been noted:
see separate sheet

**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT - SEPARATE SHEET**

International application No. PCT/GB00/02200

Re Item V

1. Reference is made to the following documents:

D1: US 5 305 469 A (CAMIADE MARC ET AL) 19 April 1994 (1004-04-19)

D2: EP 0 324 564 A (SONY CORP) 19 July 1989 (1989-07-19)

D3: EP 0 288 035 A (SHARP KK) 26 October 1988 (1988-10-26)

2. The document D1 is regarded as being the closest prior art as it discloses in combination the following features of present claim 1 (see D1; column 4, lines 25-40; column 5, lines 54-61; column 7, lines 20-31; figure 6; the references in parentheses applying to this document):

A modulator (3) comprising: a negative impedance amplifier (11) operable such that a signal applied to the amplifier is reflected and amplified, switching means (28) for switching the impedance of the amplifier into a reflective state and means (39) for binary phase switching the reflected and amplified signal.

- 2.1 The essential difference between the subject-matter of claim 1 and D1 is, that in the claim the amplifier is switched between two reflecting states and that the impedances of the two reflective states are selected to achieve the phase modulation, whereas in document D1 an additional binary phase modulator is used.

Therefore, the subject-matter of claim 1 is new (Article 33(2) PCT).

- 2.3 The problem solved by these new features can therefore be considered as how to reduce the number of components.
- 2.4 Although documents D2 and D3 disclose modulators, in which a reflected signal is phase modulated by switching the impedance in reflective states, it is not obvious

**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT - SEPARATE SHEET**

International application No. PCT/GB00/02200

to combine this feature with the teachings of D1, because these documents are not related to an amplifier. Therefore, the application meets the requirements of Article 33(3) PCT with respect to inventive step.

- 2.5 Claims 2-10 are dependent on claim 1 and, therefore, also meet the requirements of the PCT with respect to novelty and inventive step.

Re Item VII

Certain defects in the international application

To meet the requirements of Rule 5.1(a)(ii) PCT, documents D1, D2 and D3 should have been identified in the description and the relevant background art disclosed therein should have been briefly discussed.
